

Bedrock Domain Scenario

Bedrock Domain Scenario

CONFIDENTIAL - FOR INTERNAL USE BY BADGE CANDIDATES ONLY
Development Lifecycle and Deployment

Before you begin

Have a read through DevSecOps material on Services Central, and review the DevSecOps Strategy template pack which you can use to build your presentation -

<https://sfsservices.my.site.com/ServicesCentral/article/DevSecOps-Strategy-9dc018a5-a9b4-4d8e-819e-2e83bca2e442>

Instructions

Presentation Time : 30 minutes

Q & A : 20 minutes

Immediate Feedback : 10 minutes

For the hypothetical scenario described below, you will need to document and present your proposed

DevSecOps strategy followed by a Q&A session with a judge. You should:

- Prepare a presentation that covers all rubric areas and addresses key requirements. As a rough guideline, around 15 slides should be appropriate.
- Present a live or recorded demo of an end-to-end development workflow with CI/CD

You should target the presentation to the CTO, program and release management audience. In cases where requirements are not explicitly stated for the scenario, you should use your best judgment and make appropriate assumptions based on the information provided and that in the [Bedrock Overview \(Domain Zero\)](#). You should indicate any assumptions that were made when designing the proposed solution. You will not have an opportunity to ask clarifying questions related to the hypothetical scenario.

The executive will evaluate your solution in the following areas, which are equally weighted:

Objective	Weighting
Deliver an introduction with rapport building and an outline of the problem and value in solving	10%
Able to identify business requirements and understand the needs and challenges of a scenario, identifying project risks, technical risks, and their impact	10%
Shared a phased roadmap to deliver on these recommendations	10%
Prescribed a branching and modularisation strategy emphasising parallelisation	10%

Prescribed correct environment management and deployment strategies	10%
Able to describe the capabilities and constraints of the tools used	10%
Prescribed appropriate development methodology	10%
Prescribed appropriate testing strategies that mitigate project specific risks	10%
Prescribed appropriate program level and architecture governance structures	10%
Implemented the technical scenario and demonstrate it	10%

Problem Overview

Bedrock Enterprises (BE) is introducing Salesforce as a digital transformation platform and rely on their partners to build up cloud experience and best practices. The CTO initiated this program as a pilot project to the organization. The CTO has to report the status weekly to the board of BE. CTO has to convince the business there will be no bottlenecks to the organization and the project's ROI meets expectations.

Speed is key for the success of the CTO's strategy. The CTO is interested in achieving monthly production releases, as well as adopting cutting edge AI tooling to accelerate software development.

The CIO brought you in as the PA to implement a proper structure to ensure long term success and scalability of the program. You will need to propose a 12 month DevSecOps roadmap, to enable the sustainable delivery of the 3 projects inside the Salesforce program.

Across the Partner and internal teams, the current team composition is a mixture of back-end and front-end developers, with some non-developer functional consultants and Salesforce administrators.

The first two projects will be released as a single solution to business using a common production org. The third project will be deployed to a second production org according to the customer's multi-org strategy. The projects will be implemented in parallel using different partners. Each project will be managed individually by the partners. Due to regulatory and legal requirements across its Healthcare and Financial businesses, the project release timelines cannot be moved and need to be run in parallel. The Partners will utilize skilled onshore teams, as well as leverage offshore teams for the bulk of their development. Early assessment of the offshore team indicates they have an average development skill set.

Being the flagship Salesforce program at BE, the CTO and CIO have already received expert advice on Org strategy and a Data strategy, and want to use Data 360 to unify their customer profile, and support an Agentforce pilot to maximise their Salesforce return-on-investment. The Agentforce pilot will be an internal employee-facing agent that helps accelerate responses to customers, and find answers to common questions from internal company data sources.

Some challenges they have faced so far:

- Projects delivered and managed by different end partners
- Lack of specific DevSecOps skills within the program
- No program management in place
- No aligned project timeline
- Fragmented or no tools and automation in use
- Conflicting development work, and different standards from multiple developers
- Unclear environments with no wider strategy
- Uncertainty on newer technology like deploying Data 360 and Agentforce
- Low adoption of AI tooling to accelerate development and deployments
- Poor security practices on secrets management, deployment permissions, security

scans

Recommended Presentation Structure

Please follow the rough presentation sequence below, feel free to add additional sections or pages as needed:

1. Introduction
2. Challenges and risks
3. DevSecOps Phased Roadmap
4. Branching Strategy and Source Control
5. Environment Landscape
6. CI/CD tools and processes
7. Development methodologies
8. QA strategy
9. Governance
10. Demo/Walkthrough

Key Requirements

- The future goal is to be able to implement and deploy 3-5 projects in parallel
 - Ensure you consider how hotfixes or emergencies are handled in your proposal
- Key tool recommendations should be made, based on enterprise and industry trends and best practices
 - The BE solution includes core Salesforce, Omnistudio and Data 360 and Agentforce elements, and the proposal must cover how these elements will be handled by CI/CD and processes
- Branching and source control must also cover a recommendation on modularisation strategy, and discuss the merits of packaging approaches in BE's multi-org environment
- Ensure CI/CD tools & process includes key security considerations like RBAC, scans and the use of Security products (SCQA, Vulnerability, DAST)
- Governance structures proposed need to cover program governance, technical and architecture governance, and data governance
 - Consider how a requirement is traced from business requirement to built feature with test evidence
 - Consider how in a multi-SI environment, how sandboxes and branches are secured and governed, and how access might be controlled
- Sandbox type recommendations, refresh checklist, Data 360 sandbox strategy must be covered
- Clearly define personas required at each stage, including hiring recommendations and business value of each new role
- Describe tradeoffs and considerations for native and 3rd party deployment tools (For example, a customer-built pipeline vs a UI-based cloud deployment tool)
- The QA strategy must include test data management, test strategies for each type of Salesforce changes (Core Front-end + Back-end, Omni, Agents), test automation, and a recommendation of common enterprise products to support these processes

Demo Requirements

The CTO at Bedrock Enterprises expects a brief demonstration/walkthrough of how their engineering teams may implement the recommendations presented to them.

- Build a simple Salesforce app with at least one Custom Object and some Apex code and Flow, as well as the relevant permissions to access the functionality. Your work should be managed in version control, subject to some basic quality checks, and automatically deployed to a Salesforce org from the repository.
- Be prepared to walk the stakeholder through how you were able to move the changes from an org to a version control tool, what checks you chose, how an automated deployment to another org might work and showcase the metadata that has been stored in version control.
- Best practice source formats are required (SFDX Project with unpackaged or packaged metadata), and any Metadata API client of your choice can be used (SFDX CLI, VSCode SFDX Extensions etc.)
