

Bedrock Domain Scenario

Bedrock Domain Scenario

CONFIDENTIAL - FOR INTERNAL USE BY BADGE CANDIDATES ONLY

Identity and Access Management

Instructions

Presentation Time : 30 minutes

Q & A : 20 minutes

Immediate Feedback : 10 minutes

For the hypothetical scenario described below, you will need to document and present your proposed solution design followed by a Q&A session with a judge. As part of the solution you should:

- Describe an appropriate solution that meets the business requirements
- Deliver all of the required deliverables as part of that presentation
- Address trade-offs and considerations for your solution options

You should target the presentation to the Enterprise Information Technology (IT) architect audience. In cases where requirements are not explicitly stated for the scenario, you should use your best judgment and make appropriate assumptions based on the information provided and that in the [Bedrock Overview \(Domain Zero\)](#). You should indicate any assumptions that were made when designing the proposed solution. You will not have an opportunity to ask clarifying questions related to the hypothetical scenario.

You will be evaluated on your ability to assess the scenario requirements, design a solution, communicate the proposed architecture, and justify the design decisions.

The executive will evaluate your solution in the following areas:

Objective	Weighting
Identify business requirements and understand the needs and challenges of the scenario.	5%
Leverage the features and capabilities of the platform appropriately within the solution.	10%
Clearly articulate the solution design and handle objections.	5%
Describe the details of the authentication flows including the role of the browser, MFA, and MyDomain.	20%
Use platform features to capture information upon login, and enforce additional security measures.	5%
Describe the appropriate details of the authorization flow with user interaction.	10%
Describe the appropriate details of the authorization flow for server-to-server interaction.	10%

Describe how identity management is handled (provisioning, syncing, deprovisioning)	15%
Describe complex authorization flows with external parties, including the use of connected apps.	10%
Describe appropriate trade offs, considerations and alternative options.	5%
Leverage identity capabilities for advanced authentication and authorization mechanisms for external users.	5%

Expected Deliverables

- Please use the following template to guide your presentation. You may add slides, but only if required to further explain your solution. The solution should not have more than 10 slides (excluding transition and agenda slides).
- The executive who you are presenting to is very busy. Please ensure that you only schedule time during the windows s/he has made available

Problem Overview

Bedrock Enterprises (BE) is committed to modernizing its identity and access management capabilities through its "One Bedrock" initiative. This strategic effort seeks to unify user access across its Financials, Healthcare, and Transportation divisions by implementing a centralized, secure, and scalable identity framework.

The organization envisions a seamless access experience for internal staff, partners, and customers—eliminating redundant logins, enabling policy-driven automation for user lifecycle events, and providing secure and intuitive access across devices and channels. With the goal of improving both productivity and compliance, BE aims to replace fragmented processes with a unified identity model that integrates existing Active Directory infrastructures through modern federation protocols.

Key outcomes of this transformation include strong authentication for mobile and sensitive systems, federated identity support for external users, and self-service capabilities that reduce administrative burden. Salesforce will act as the central hub for access orchestration, aligning with identity standards to ensure interoperability and governance.

System Landscape

Bedrock Enterprises operates in a hybrid identity environment.

- **LDAP/AD Credential Stores:** BE uses multiple Active Directory instances across its divisions for internal users. Some are cloud-based, others on-premise. No change to the existing AD structure is expected.
- **Salesforce Access:** Internal users access Salesforce only through a corporate intranet portal that provides a secure access point and ensures internal firewall protections.
- **Partner Access:** Partners are authenticated against a separate AD credential store specifically managed for third-party and B2B relationships.
- **Customer Authentication:** Customers use self-registration, with a plan to support login through Google, Facebook, or LinkedIn.
- **Document Management System (DMS):** Customer documents, especially in Wealth Management, are stored in an external DMS. The DMS does not allow credential storage or usage of system users
- **Credit Check Integration:** An external credit verification service for customer provisioning. Salesforce should initiate the credit check in real time via a secure API call.

Accessibility and Security Requirements

Employee Access

- Internal staff often work across multiple business units. They need a login experience that reflects the company's vision of "One Bedrock"—a single access point, governed by their existing corporate credentials via SSO using the current LDAP/AD infrastructure.
- As employees join or leave Bedrock, their system access must update automatically. No manual admin action should be required.
- Employees and clients of Bedrock Financials increasingly rely on mobile devices to interact with critical data. A secure, branded mobile app must guard against unauthorized access and phishing threats using strong, mobile-appropriate second factors such as SMS-based OTPs.
- For security and compliance, internal staff should always authenticate using corporate tools. Password resets and account recovery must be governed centrally. Salesforce must suppress internal reset features.

Customer Access

- Potential customers exploring Bedrock's services expect quick and easy sign-up options. By offering familiar login options like Google, Facebook, or LinkedIn.
- Not all customers are eligible for immediate onboarding. A responsible onboarding system should validate a new customer's background in real time using an external credit check API. Salesforce must only provision users if the check is successful, otherwise returning a user-friendly error.
- Once onboarded, new customers should feel immediately supported through a personalized welcome email and access to a helpful guide that introduces them to Bedrock's services.

Additional Security Measures

- Wealth management documents are highly sensitive. Only verified users should be allowed to access the DMS, and the solution must ensure credentials are never exposed or stored insecurely.
- In today's mobile-first environment, it is critical to ensure that a misplaced or stolen device does not compromise the integrity of sensitive systems. When a user loses access to their mobile device, the platform must respond swiftly by revoking active sessions and preventing unauthorized use.
- Every interaction between users and systems should be governed by secure, verifiable protocols that prevent tampering or misuse. To establish digital trust, Bedrock must ensure that authentication and data exchange mechanisms are built on industry-standard encryption and validation.
- In support of transparency and legal compliance, Bedrock requires that all new customers must review and accept a "Terms of Service agreement" upon their initial login. This prompt should appear only once—during the user's first successful login—and must capture explicit consent before granting access to the platform.
- Bedrock aims to provide a flexible authentication mechanism for its partner community using Experience Cloud. Each partner organization prefers to

authenticate its users using their own enterprise identity provider.

- To support frictionless customer transactions, Bedrock aims to allow users to authorize the use of their PayPal account during checkout. Customers should both authenticate and authorize payment in a single session. This should reduce drop-offs and boost conversion rates. The challenge lies in handling identity mapping between PayPal and Salesforce, ensuring authenticated sessions translate into trusted user identities while maintaining secure handoff between authentication and payment contexts.
- Bedrock Enterprise requires a seamless and fully branded login experience within its custom web portal, eliminating traditional passwords to enhance user experience and security. To achieve this, the solution must implement headless identity flows, leveraging Salesforce as the authoritative identity provider while maintaining complete control over the front-end user interface and journey.

Expectations

- Present a high-level architecture diagram illustrating how Salesforce integrates with external systems.
- Describe authorisation/authentication workflows, highlighting transition and system touch point.
- Clearly explain how Salesforce connects and synchronizes with:
 - Internal and external directories.
 - Identity providers.
 - External service providers including SMS gateways, credit bureaus, and document management systems.
- Articulate the rationale behind key architectural decisions, including any trade-offs made, and provide alternative approaches considered during design.
